Advances in Group Theory and Applications

Lecce, September 5th-8th
2017

Definition (Rump, 2005)

Let X be a non-empty set and \cdot a binary operation on X .

The pair (X, \cdot) is said a *left cycle set* if for all $x, y, z \in X$ it holds

$$(x \cdot y) \cdot (x \cdot z) = (y \cdot x) \cdot (y \cdot z) \quad (1)$$

and the left multiplication $\sigma_x : X \longrightarrow X$, $y \longmapsto x \cdot y$ is bijective, for every $x \in X$.

We call (X, \cdot) *non-degenerate* if the squaring map $q : X \longrightarrow X$, $x \longmapsto x \cdot x$ is bijective.

We denote by $\mathcal{G}(X)$ the subgroup of $\text{Sym}(X)$ on X generated by $\{\sigma_x | x \in X\}$.

We call $\mathcal{G}(X)$ the *permutation group* of X .

Definition (Rump, 2005)

Cycle sets and
the Yang-Baxter
equation

Dynamical
extension of left
cycle sets

Finite retractable
indecomposable
left cycle set

This new algebraic structure was introduced by Rump in order to find all set-theoretic solutions of the Yang-Baxter equation.

Definition

Let X be a non-empty set, $r : X \times X \rightarrow X \times X$ a map and write

$$r(x, y) = (\lambda_x(y), \gamma_y(x))$$

for all $x, y \in X$.

Then (X, r) is said to be a non-degenerate involutive set-theoretic solution of the Yang-Baxter equation if and only if the following properties hold:

- (1) $r^2 = id_{X^2}$; (r is involutive)
- (2) $\lambda_x, \gamma_y \in Sym_X$ for all $x \in X$; (r is non degenerate)
- (3) $r_1 r_2 r_1 = r_2 r_1 r_2$

where $r_1 = r \times id_X$ and $r_2 = id_X \times r$.

Convention: From now on, by a solution I mean a non-degenerate involutive set-theoretic solution.

Definition

Let X be a non-empty set, $r : X \times X \rightarrow X \times X$ a map and write

$$r(x, y) = (\lambda_x(y), \gamma_y(x))$$

for all $x, y \in X$.

Then (X, r) is said to be a non-degenerate involutive set-theoretic solution of the Yang-Baxter equation if and only if the following properties hold:

- (1) $r^2 = id_{X^2}$; (r is involutive)
- (2) $\lambda_x, \gamma_y \in Sym_X$ for all $x \in X$; (r is non degenerate)
- (3) $r_1 r_2 r_1 = r_2 r_1 r_2$

where $r_1 = r \times id_X$ and $r_2 = id_X \times r$.

Convention: From now on, by a solution I mean a non-degenerate involutive set-theoretic solution.

Definition

Let X be a non-empty set, $r : X \times X \rightarrow X \times X$ a map and write

$$r(x, y) = (\lambda_x(y), \gamma_y(x))$$

for all $x, y \in X$.

Then (X, r) is said to be a non-degenerate involutive set-theoretic solution of the Yang-Baxter equation if and only if the following properties hold:

- (1) $r^2 = id_{X^2}$; (r is involutive)
- (2) $\lambda_x, \gamma_y \in Sym_X$ for all $x \in X$; (r is non degenerate)
- (3) $r_1 r_2 r_1 = r_2 r_1 r_2$

where $r_1 = r \times id_X$ and $r_2 = id_X \times r$.

Convention: From now on, by a solution I mean a non-degenerate involutive set-theoretic solution.

A possible tool to classify the solutions of the Yang-Baxter equation is to study their decomposability and analyze the potential r – *invariant* subsets.

Definition

Let (X, r) be a solution then a subset Y of X is said r – *invariant* if $r(Y \times Y) \subseteq Y \times Y$.

In terms of left cycle sets, recall that $\mathcal{G}(X)$ is the permutation group of X .

Definition

A subset Y of X is called *invariant* when $\sigma_x(Y) \subseteq Y$ for every $x \in Y$ and $\mathcal{G}(X)$ – *invariant* when $\sigma_x(Y) \subseteq Y$ for every $x \in X$.

Vendramin in 2016, inspired by the theory of rack and quandle, characterized the finite left cycle sets in terms of dynamical extension.

Definition

Let I be a left cycle set, S a non-empty set and $\alpha : I \times I \times S \longrightarrow \text{Sym}(S)$, $(i, j, s) \mapsto \alpha_{i,j}(s, -)$. Then α is said *dynamical cocycle of I* if and only if

$$\alpha_{i \cdot j, i \cdot k}(\alpha_{i,j}(r, s), \alpha_{i,k}(r, t)) = \alpha_{j \cdot i, j \cdot k}(\alpha_{j,i}(s, r), \alpha_{j,k}(s, t)).$$

Then, if α is a dynamical cocycle then $S \times_{\alpha} I := (S \times I, \cdot)$ is a left cycle set where

$$(s, i) \cdot (t, j) := (\alpha_{i,j}(s, t), i \cdot j). \quad (2)$$

$(S \times_{\alpha} I)$ is called the **dynamical extension of I by α** .

Vendramin in 2016, inspired by the theory of rack and quandle, characterized the finite left cycle sets in terms of dynamical extension.

Definition

Let I be a left cycle set, S a non-empty set and $\alpha : I \times I \times S \longrightarrow \text{Sym}(S)$, $(i, j, s) \mapsto \alpha_{i,j}(s, -)$. Then α is said *dynamical cocycle of I* if and only if

$$\alpha_{i,j,i \cdot k}(\alpha_{i,j}(r, s), \alpha_{i,k}(r, t)) = \alpha_{j \cdot i,j \cdot k}(\alpha_{j,i}(s, r), \alpha_{j,k}(s, t)).$$

Then, if α is a dynamical cocycle then $S \times_{\alpha} I := (S \times I, \cdot)$ is a left cycle set where

$$(s, i) \cdot (t, j) := (\alpha_{i,j}(s, t), i \cdot j). \quad (2)$$

$(S \times_{\alpha} I)$ is called the **dynamical extension of I by α** .

Vendramin in 2016, inspired by the theory of rack and quandle, characterized the finite left cycle sets in terms of dynamical extension.

Definition

Let I be a left cycle set, S a non-empty set and $\alpha : I \times I \times S \longrightarrow \text{Sym}(S)$, $(i, j, s) \mapsto \alpha_{i,j}(s, -)$. Then α is said *dynamical cocycle of I* if and only if

$$\alpha_{i,j,i \cdot k}(\alpha_{i,j}(r, s), \alpha_{i,k}(r, t)) = \alpha_{j \cdot i,j \cdot k}(\alpha_{j,i}(s, r), \alpha_{j,k}(s, t)).$$

Then, if α is a dynamical cocycle then $S \times_{\alpha} I := (S \times I, \cdot)$ is a left cycle set where

$$(s, i) \cdot (t, j) := (\alpha_{i,j}(s, t), i \cdot j). \quad (2)$$

$(S \times_{\alpha} I)$ is called the **dynamical extension of I by α** .

Example (*Rump's semidirect product*)

Let I and S be left cycle sets and suppose that I acts on S , which means that there is a map $I \times S \rightarrow S$, $(i, s) \mapsto {}^i s$ such that

- 1) ${}^i(s \cdot t) = {}^i s \cdot {}^i t$
- 2) $(i \cdot j) {}^i s = (j \cdot i) {}^j s$
- 3) The map $S \rightarrow S$, $s \mapsto {}^i s$ is bijective

for all $i, j \in I$, $s, t \in S$. Put $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$

$$\alpha(i, j, s)(t) := (i \cdot j) {}^i s \cdot (j \cdot i) {}^j t.$$

Then $S \times_{\alpha} I$ is a left cycle set.

It's remarkable to see that this left cycle set coincides with Rump's semidirect product.

Example (*Rump's semidirect product*)

Let I and S be left cycle sets and suppose that I acts on S , which means that there is a map $I \times S \rightarrow S$, $(i, s) \mapsto {}^i s$ such that

- 1) ${}^i(s \cdot t) = {}^i s \cdot {}^i t$
- 2) $(i \cdot j) {}^i s = (j \cdot i) {}^j s$
- 3) The map $S \rightarrow S$, $s \mapsto {}^i s$ is bijective

for all $i, j \in I$, $s, t \in S$. Put $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$

$$\alpha(i, j, s)(t) := (i \cdot j) {}^i s \cdot (j \cdot i) {}^j t.$$

Then $S \times_{\alpha} I$ is a left cycle set.

It's remarkable to see that this left cycle set coincides with Rump's semidirect product.

Example (*Rump's semidirect product*)

$$1) \quad {}^i(s \cdot t) = {}^i s \cdot {}^i t$$

$$2) \quad (i \cdot j) {}^i s = (j \cdot i) {}^j s$$

$$3) \quad \text{The map } S \rightarrow S, s \mapsto {}^i s \text{ is bijective}$$

for all $i, j \in I$, $s, t \in S$. Put $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$

$$\alpha(i, j, s)(t) := (i \cdot j) {}^i s \cdot (j \cdot i) {}^j t.$$

Then $S \times_{\alpha} I$ is a left cycle set.

It's remarkable to see that this left cycle set coincides with Rump's semidirect product.

Example (*Rump's semidirect product*)

Let I and S be left cycle sets and suppose that I acts on S , which means that there is a map $I \times S \rightarrow S$, $(i, s) \mapsto {}^i s$ such that

- 1) ${}^i(s \cdot t) = {}^i s \cdot {}^i t$
- 2) $(i \cdot j) {}^i s = (j \cdot i) {}^j s$
- 3) The map $S \rightarrow S$, $s \mapsto {}^i s$ is bijective

for all $i, j \in I$, $s, t \in S$. Put $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$

$$\alpha(i, j, s)(t) := (i \cdot j) {}^i s \cdot (j \cdot i) {}^j t.$$

Then $S \times_{\alpha} I$ is a left cycle set.

It's remarkable to see that this left cycle set coincides with Rump's semidirect product.

Example (*Rump's semidirect product*)

Let I and S be left cycle sets and suppose that I acts on S , which means that there is a map $I \times S \rightarrow S$, $(i, s) \mapsto {}^i s$ such that

- 1) ${}^i(s \cdot t) = {}^i s \cdot {}^i t$
- 2) $(i \cdot j){}_S = (j \cdot i){}_S$
- 3) The map $S \rightarrow S$, $s \mapsto {}^i s$ is bijective

for all $i, j \in I$, $s, t \in S$. Put $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$

$$\alpha(i, j, s)(t) := (i \cdot j)_S \cdot (j \cdot i)_t.$$

Then $S \times_{\alpha} I$ is a left cycle set.

It's remarkable to see that this left cycle set coincides with Rump's semidirect product.

Example (*Rump's semidirect product*)

Theorem (Vendramin, 2016)

*Let X, I be a finite left cycle sets and $p : X \rightarrow I$ a covering map.
Then, there exist a non-empty set S and a dynamical cocycle α such
that $X \cong S \times_{\alpha} I$.*

Now we give a characterization of indecomposable left cycle sets written in terms of dynamical extensions.

Definition

Let I be a left cycle set, S a non-empty set and $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$ a cocycle. For every $i \in I$, let H_i be the subset of the permutation group $\mathcal{G}(S \times_{\alpha} I)$ given by

$$H_i := \{h \in \mathcal{G}(S \times_{\alpha} I) \mid h(S \times \{i\}) \subseteq S \times \{i\}\}.$$

It's easy to see that H_i is a subgroup of $\mathcal{G}(S \times_{\alpha} I)$ for every $i \in I$.

Now we give a characterization of indecomposable left cycle sets written in terms of dynamical extensions.

equationDynamical
extension of left
cycle setsFinite retractable
indecomposable
left cycle set

It is well known that if I is a left cycle set then it is indecomposable if and only if its permutation group $\mathcal{G}(I)$ acts transitively on I .

Theorem (M. Castelli, F. Catino, G.P., in preparation)

Let I be a left cycle set, S a non-empty set and $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$ a dynamical cocycle. Then $S \times_{\alpha} I$ is indecomposable if and only if I is indecomposable and there exists $i \in I$ such that H_i is transitive on $S \times \{i\}$.

It is well known that if I is a left cycle set then it is indecomposable if and only if its permutation group $\mathcal{G}(I)$ acts transitively on I .

Theorem (M. Castelli, F. Catino, G.P., in preparation)

Let I be a left cycle set, S a non-empty set and $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$ a dynamical cocycle. Then $S \times_{\alpha} I$ is indecomposable if and only if I is indecomposable and there exists $i \in I$ such that H_i is transitive on $S \times \{i\}$.

Example

Let $I := \mathbb{Z}/2\mathbb{Z}$ be the indecomposable left cycle set defined by $x \cdot y := y + 1$ and let $S := \{1, 2, 3\}$ and $\alpha : I \times I \times S \longrightarrow \text{Sym}(S)$ given by $\alpha_{(i,j,s)} := (1\ 2\ 3)$ for all $i, j \in I$ and $s \in S$. Then the left cycle set $S \times_{\alpha} I$ is indecomposable: indeed I is indecomposable, $H_1 = H_2 = H_3 = \langle (1\ 3\ 2) \rangle$ and H_1 is transitive on $S \times \{1\}$.

Finite retractable
indecomposable
left cycle set

The previous results suggest a characterization of all finite retractable indecomposable left cycle set.

We recall that if X is a left cycle set we can define an equivalence relation

$$x \sim y :\Leftrightarrow \sigma_x = \sigma_y$$

Then, $\text{Ret}(X) := X / \sim$ is a left cycle sets if and only if X is non degenerate.

$$\text{Ret}^n(X) := \text{Ret}^{(n-1)}(\text{Ret}(X))$$

A left cycle set is called *irretractable* if $\text{Ret}(X) \cong X$ and *retractable* otherwise.

Moreover a left cycle set is called *multipermutational of level n* if n is the minimal integer such that $|\text{Ret}^n(X)| = 1$.

We recall that if X is a left cycle set we can define an equivalence relation

$$x \sim y :\Leftrightarrow \sigma_x = \sigma_y$$

Then, $\text{Ret}(X) := X / \sim$ is a left cycle sets if and only if X is non degenerate.

$$\text{Ret}^n(X) := \text{Ret}^{(n-1)}(\text{Ret}(X))$$

A left cycle set is called *irretractable* if $\text{Ret}(X) \cong X$ and *retractable* otherwise.

Then, $Ret(X) := X / \sim$ is a left cycle sets if and only if X is non degenerate.

$$Ret^n(X) := Ret^{(n-1)}(Ret(X))$$

A left cycle set is called *irretractable* if $Ret(X) \cong X$ and *retractable* otherwise.

Moreover a left cycle set is called *multipermutational of level n* if n is the minimal integer such that $|Ret^n(X)| = 1$.

Proposition (M. Castelli, F. Castelli. G.P., in preparation)

Let I be a finite retractable left cycle set. Then I is indecomposable if and only if $\text{Ret}(I)$ is indecomposable and there exist a set S , a dynamical cocycle α and $x \in \text{Ret}(I)$ such that

$$I \cong S \times_{\alpha} \text{Ret}(I)$$

and H_x is transitive on $S \times \{x\}$.

Observation: the canonical epimorphism $f : I \rightarrow \text{Ret}(I)$ is a covering map, unlike the decomposable case.

Finite retractable
indecomposable
left cycle set

In the following proposition we give a characterization of finite left cycle set of level k starting from a finite left cycle set of level $k - 1$ in terms of dynamical extensions of left cycle sets.

Recall that a left cycle set X is called *multipermutation of level m* , if m is the minimal non-negative integer such that $\text{Ret}^m(X)$ has cardinality one.

In the following proposition we give a characterization of finite left cycle set of level k starting from a finite left cycle set of level $k - 1$ in terms of dynamical extensions of left cycle sets.

Recall that a left cycle set X is called *multipermutation of level m* , if m is the minimal non-negative integer such that $\text{Ret}^m(X)$ has cardinality one.

Proposition

Let X be a finite left cycle set. Then X is an indecomposable left cycle set of level k if and only if there exist a left cycle set I , a set S and a dynamical cocycle α such that $X \cong S \times_{\alpha} I$ and the following properties hold:

- 1) I is an indecomposable left cycle set of level $k - 1$;*
- 2) $\alpha(i, j, s) = \alpha(i, j, t)$ for every $s, t \in S$, $i, j \in I$;*
- 3) $\alpha(i, j, s) \neq \alpha(i', j, t)$ for every $i \neq i'$, $i, i', j \in I$, $s, t \in S$;*
- 4) there exists $i \in I$ such that H_i is transitive on $S \times \{i\}$.*

Proposition

Example

Let $I := (\mathbb{Z}/2\mathbb{Z}, \cdot)$ be the left cycle set given by $x \cdot y := y + 1$ and $S := \mathbb{Z}/2\mathbb{Z}$. Let $\alpha : I \times I \times S \rightarrow \text{Sym}(S)$ be the function given by

$$\alpha(0, 0, 0) = \alpha(0, 0, 1) = \alpha(1, 1, 0) = \alpha(1, 1, 1) := t_1$$

$$\alpha(0, 1, 0) = \alpha(0, 1, 1) = \alpha(1, 0, 0) = \alpha(1, 0, 1) := id_S$$

Then α is a cocycle and $S \times_\alpha I$ is an indecomposable left cycle set and $mpl(S \times_\alpha I) = 2$.
