Associative algebras on affine spaces or affgebras

- An associative algebra is a vector space A with an associative bi-linear multiplication  $m : A \times A \rightarrow A$ .
- The bi-linearity of m implies that multiplication distributes over the addition according to the ring distributive law.

(ロ) (同) (三) (三) (三) (○) (○)

▶ What an affine space with an associative bi-affine multiplication  $m : A \times A \rightarrow A$  is?

In an affine space A over a vector space V:
 (a) any a, b ∈ A differ by a unique vector ab;

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

▶ In an affine space *A* over a vector space *V*:

- (a) any  $a, b \in A$  differ by a unique vector ab;
- (b) any point can be shifted by a vector to a (unique) point, in particular, for all  $a, b, c \in A$ ,

$$a + \overrightarrow{bc} \in A;$$

Where is the vector space? Fix an  $o \in A$ , then the abelian group  $\mathcal{G}(A, o)$  with scalar multiplication:

$$\alpha a = \alpha \triangleright_o a$$

is a vector space. A vector from a to b: ab = [o, a, b]

A morphism of affine spaces (A,V) to (B,W) is a function  $f:A\to B$  which induces a linear transformation  $\widehat{f}:V\to W$  such that

$$\widehat{f}\left(\overrightarrow{ab}\right) = \overrightarrow{f(a)f(b)}.$$

This is equivalent to say that f is a morphism of heaps such that

$$f(\lambda \triangleright_a b) = \lambda \triangleright_{f(a)} f(b)$$

(ロ) (同) (三) (三) (三) (○) (○)

# Trusses [TB '19]

Let A be an affine space with an associative bi-affine multiplication

$$m: A \times A \to A, \qquad (a, b) \longmapsto ab.$$

What kind of distributivity we get?

(i) m is a heap morphism on the left argument:

$$[a, b, c]d = [ad, bd, cd],$$

(ii) m is a heap morphism on the right argument:

$$a[b, c, d] = [ab, ac, ad].$$

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

An abelian heap A with an associative multiplication satisfying (i)-(ii) is called a **truss**.

#### Comments on trusses

ln a ring, a0 = 0a = 0, by the distributive laws.

The truss distributive laws on an abelian group heap read:

 $(a-b+c)d = ad - bd + cd, \qquad a(b-c+d) = ab - ac + ad.$ 

This **does not** imply that a0 = 0a = 0.

An abelian group is a truss with any of these products:

ab = a + b, ab = a, ab = b, ab = const.

 Odd integers and odd fractions are trusses with the usual multiplication.

## Two types of distributive laws

**Ring-type**:  $(R, +, \cdot)$ :

$$a(b+c) = ab + ac, \qquad (b+c)a = ba + ca \quad (R).$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

Consequence: a0 = 0a = 0, hence no  $0^{-1}$ .

## Two types of distributive laws

Ring-type:  $(R, +, \cdot)$ :

 $a(b+c) = ab + ac, \qquad (b+c)a = ba + ca \quad (R).$ 

Consequence: a0 = 0a = 0, hence no  $0^{-1}$ .

Brace-type:  $(R, +, \cdot)$ :

$$a(b+c)=ab-a+ac, \qquad (b+c)a=ba-a+ca \ (B).$$

Consequence: 0 = 1, hence all elements can be invertible.

#### Betwixt and between

► Let (A, [-, -, -], ·) be a truss such that (A, ·) is a monoid with identity 1. Then (A, +1, ·) satisfies the brace-type distributive law.

### Betwixt and between

► Let (A, [-, -, -], ·) be a truss such that (A, ·) is a monoid with identity 1. Then (A, +1, ·) satisfies the brace-type distributive law.

▶ Let  $(A, [-, -, -], \cdot)$  be a truss. Assume that  $0 \in A$  is such that

 $a \cdot 0 = 0 = 0 \cdot a$ , for all  $a \in A$ .

Then  $(A, +_0, \cdot)$  is a ring.

Trusses can be understood as:

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

Trusses can be understood as:

 Algebras on affine Z-spaces (compare: rings are algebras over Z).

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Trusses can be understood as:

 Algebras on affine Z-spaces (compare: rings are algebras over Z).

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

► Slices of rings over Z.

Trusses can be understood as:

- Algebras on affine Z-spaces (compare: rings are algebras over Z).
- Slices of rings over Z. If *f* : *R* → Z is a surjective (non-unital) ring homomorphism, then *f*<sup>-1</sup>(1) ⊆ *R* is a truss [RR Andruszkiewicz, TB, B Rybołowicz '22].

$$a \cdot (b+c) = \mu(a,b) + (a \cdot c).$$

• There exist  $\kappa, \hat{\kappa} : A \times A \to A$ , such that

$$a \cdot (b+c) = \kappa(a,b) + \hat{\kappa}(a,c).$$

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

Let (A, +) be a group and  $(A, \cdot)$  be a semigroup. TFAE:

• There exists  $\sigma : A \to A$ , such that

$$a \cdot (b+c) = (a \cdot b) - \sigma(a) + (a \cdot c).$$

• There exists  $\lambda : A \times A \rightarrow A$ , such that,

$$a \cdot (b+c) = (a \cdot b) + \lambda(a, c).$$

• There exists  $\mu : A \times A \rightarrow A$ , such that

$$a \cdot (b+c) = \mu(a,b) + (a \cdot c).$$

• There exist  $\kappa, \hat{\kappa} : A \times A \to A$ , such that

$$a \cdot (b+c) = \kappa(a,b) + \hat{\kappa}(a,c).$$

$$\blacktriangleright a \cdot [b, c, d]_+ = [a \cdot b, a \cdot c, a \cdot d]_+$$

#### Theorem

Let  $\mathcal{E}$  be a nonsingular complex elliptic curve.

• Endomorphisms of  $\mathcal{E}$  are endomorphisms of  $H(\mathcal{E})$ .

# Trusses and ellitpic curves

Figure: Construction of the heap  $H(\mathcal{E})$  on a curve  $\mathcal{E}$ 

#### Theorem

Let  $\mathcal{E}$  be a nonsingular complex elliptic curve.

- Endomorphisms of  $\mathcal{E}$  are endomorphisms of  $H(\mathcal{E})$ .
- Endomorphisms of  $\mathcal{E}$  form a truss  $T(\mathcal{E})$  with product  $\circ$  and

 $[f,g,h](A) = [f(A),g(A),h(A)], \qquad \text{for all } A \in \mathcal{E},$

# Summary

- Affine spaces are equipped with a natural ternary operation that makes them into abelian heaps.
- An affine space with a bi-affine multiplication becomes a truss (multiplication distributes over the ternary operation).
- Every ring is a truss, every brace is a truss; trusses are a bridge between rings and braces.
- All trusses can be embedded universally in rings (albeit as trusses NOT as rings).

(ロ) (同) (三) (三) (三) (○) (○)

All trusses arise as (nonunital) extensions of  $\mathbb{Z}$  by ideals.
